two large single-decker buses, and would also be faster than the IL-14. Up to May 1958 a prototype had not been completed, although work on the assembly of one, in No. 35 Shop, began in January 1958. By May 1958	50X1-HUM
the frame of the fuselage was visible and appeared to be about 40 meters long by four to five meters in diameter. testing was expected to begin in October 1958, and, as with the IL-14, both civil and military versions would be produced.	50X1-HUM
At Shop No. 15 between 32 and 35 petrol tanks, each of between 700-800 liters capacity, were produced daily. Some of these were for current plant production, and were sent direct to Shop No. 35 for fitting (the IL-14 had six to eight tanks). The remainder went to Shop No. 37 for packing and export to Soviet bloc countries using this aircraft.	5074 11110
	50X1-HUM
Production Reported	
Production of the twin-engined passenger aircraft IL-14 ceased in March 1958, since when the resources of aircraft assembly plant 84B have been entirely devoted to the development and production of a new type, IL-17. Planning of the IL-17 began in early 1957, and the aircraft was still in the experimental stage in March 1959. Doth military and civil versions of the aircraft, for both freight and passenger transport, are aimed at; up to March 1959 only military freighter prototypes had been produced, although civil versions, both freight and passenger, were, it was rumored, to be turned out in summer 1959.	50X1-HUM
The IL-17 is a twin-engined turbojet aircraft. The estimated length of the fuselage is 38 to 40 meters, diameter of fuselage 3½ meters, and wing-span 35 meters. The wings are placed at the top of the fuselage. its weight is 12 to 14 tons and a matter of concern to the designers who, in March 1959, were considering what steps to take in order to reduce it. The aircraft was said to be able to carry one medium-sized tank with its crew or two small single-decker buses, without passengers. The military version was to be armed with a "gun" on top of the fuselage, at the junction of the wings, one rear machine gun and one machine gun "underneath" the fuselage. There is a rear loading door and another on the left side of the fuselage. The interior of the aircraft is entirely of duraluminum.	50X1-HUM 50X1-HUM
Production of a prototype began in March 1958. In July 1958 the first aircraft was sent by rail, in crated sections, to the town 6f Saratov, where there is an aircraft testing establishment. It was returned to Tashkent in August 1958 for assembly. In September 1958 its trials took place at the airfield adjoining the factory, and were attended by a delegation from the Air Ministry /sic; GKAT? in Moscow, consisting of two Soviet Air Force Generals, Sokolov (fnu) and Kokkinakes (fnu) and by /S.Y. Ilyushin, the designer of the aircraft. Kokkinakes flew the aircraft on its first flight. ²	50X1-HUM
In October 1958 a further three IL-17's were produced. By March 1959 full-scale production had still not begun, although four or five aircraft were produced in both February and March 1959. During March, six to seven IL-17's were observed on the airfield. An unknown number of technicians from the factory was sent to Saratov on a special training course, connected with production of the IL-17, lasting three months, at the end of 1958. They returned to Tashkent in March 1959.	
S-E-C-R-E-T	
	EOV1 LILIM

When production of the IL-17 began in March 1958, certain changes in the organization of shops at Plant 84B were planned in order to meet the differing requirements. Some shops were to be transferred from the large building which housed the final aircraft assembly ahopo (No.)5) to a new building immediately west of the airfield. This and other changes were designed so that, without any enlargement to the building itself, more room would be available inside Shop No. 35 to allow for the larger size of the new aircraft.			s in the the the large o menu es were , more er size of	50X1-HUI 50X1-HUI

7. This factory produces unspecified aircraft component parts for use at 84B, but also turns out aluminium articles for domestic and kitchen use,

Factory No. 84C.

Otherwise known as No.13 Shop, this factory is about 5 kilometres North-East of TASHKENT and close to the CHIRCHES from which a reilway-line enters the factory premises. FRUALSON of observation) it consisted to one brick building, c.100 x 50 metres, was

SECRET 50X1-HUM

plus 5-6 timber storehouses. It employs 60-80 workmen. This factory is devoted entirely to timber-work: spart from wooden aircraft components for use at 84B, it also turns out wooden articles (supboards, tables etc.) for the use of the factory officials,

Airfield

Out of bounds to workern at 84B. One NE-SW tarmac runway of 9. estimated length 1000 metres. The airfield is used both for testing and flying away aircraft produced at 84B, and by the Russian Air Force; in May 1958, about twenty small jet aircraft and six helicopters were usually to be seen parked on the North side of the airfield; distance made closer identification impossible.

At the Eastern extremity of the airfield, in March 1958, thirty workmen from 84B were employed mixing concrete, both for the use of the factory and of the airfield; in the latter case for the comcreting of all aprons and taxiways and, according to the workmen concerned, for new constructions, of which no details were known, on the North side of the airfield.

On the East side of the airfield, in a wooded area, there were barracks for an estimated 200 men.

CHKALOV Aircraft Assembly Plant 845 at TASHKENT. (March 1959)

•	
1.	Production:
	T TOUGH GAOIT

D-17. A

Production of the twin-engined passenger aircraft II-14 ceased in March 1958, since when the resources of aircraft assembly plant 84B have been entirely devoted to the development and production of a new type,

Planning of the II-17 began in early 1957, and the aircraft was still in the experimental stage in March 1959.

both military and civil versions of the aircraft, for both freight and passenger transport, are aimed at; up tilt March 1959 only military freighter prototypes had been produced, although civil versions, both freight and passenger, were, it was runoured, to be turned out in the summer of 1959.

is a twin-engined turbojet aircraft, the estimated length of the fuselage is 38 TP 40 methos, diameter of fuselage 3½ methos, and wing-span 35 methos.

The wings are placed at the top of the fuselage.

its weight is 12 14 tons and a matter of concern to the designers who, in March 1959, were considering what steps to take in order to reduce it. The aircraft was said to be able to carry one medium-sized tank with its crew or two small, single-decker buses, without passengers. The military version was to be armed with a "gun" on top of the fuselage, at the junction of the wings, one rear machine-gun and one machine-gun "underneath" the fuselage. There is a rear loading door and another on the left side of the fuselage. The interior of the aircraft is entirely of duraluminium.

Production of a prototype began in March 1958. In July 1958 the first aircraft was sent by rail, in crated sections, to the town of Sartov, where there is an aircraft testing establishment. It was returned to Tarton in August 1958 for assembly. In September 1958 its trials took place at 50X1-HUM the airfield adjoining the factory, and were attended by a delegation from the Lir Ministry in March, consisting of two Soviet air rorce teneral.

An unknown number of technicians from the observed on the airfield. factory word sent to SARITOV on a special training course, connected with production of the II-17, lasting three months, at the end of 1958; they returned to TANTAIN in March 1959. Staff: The total staff at Plant 84B is about 7,000, of whom an estimated 1,200 are administrative, i.e. not directly engaged in production. Manager of the entire factory group (844, 3 and C) from 1956 until December 1957 was SLLLWiOV (fnu) who was dismissed at the end of 1957 for failing to keep production at the required level. His replacement, who was still in office in March 1959, was KANTISIOV (fhu) a Russian Jew aged 50X1-HUM a Communist Party member, married, and resident in a luxurious house in TASHKENT. The Deputy Manager of the group since 1950 is a retired hir Force Lieutenant-Colonel nemod KOUZOUNOV (fnu) He is assisted by 50X1-HUM who was also Mikhail Yurovitch KLENHIN, a Russian Jew, married, appointed in 1950, and who in addition to these duties controls the factory motor transport (No.39 Shop). The Communist Party's chief representative in the factory, since 1950, named N.Z.RLN (fnu). is an immenian 50X1-HUM The Chief Engineer is named P.SPELOV (fnu). Other officials included: head of No. 24 Shop (wing Gevren Sergeyevitch KHLL POV, 50X1-HUM sections) since late 1956 ISMILIOV (fnu), head of No.15 head of No.10 Shop (rubber petrol tanks CHEKLINOV (fina) 50X1-HUM

50X1-HUM

-3-

9. Organisational Changes since March 1958:

When production of II-17 began in March 1958, certain changes in the organisation of Shops at Plant 84B were planned in order to meet the differing requirements. These were as follows:

- (a) In the large building which housed the final aircraft assembly point (No.35 Shop) as well as Shops No.14 (internal fittings of fuselage) No.18 (aircraft flooring) No.24 (wing sections) and No. 26 (upholstery of aircraft seats), Shops No.35 and 14 remain, but Shops No.18, 24 and 28 are to be transferred to a new building immediately west of the airfield. In place of Shop 18, Shop No. 5 from Plant 84. (using 50 and 60 ton presses for manufacture of engine cowlings, etc) is to be moved in and analgamated with Shop No.14. No.17 Shop (small metal components) is taking the place of Shop No.24. The total effect of those changes was intended to be that, without any enlargement of the building itself, more room would be available inside for No.35 shop to allow for the larger size of the new circraft.
- (b) The new building, c.150 x 100 metres, immediately west of the airfield, is of concrete and brick construction, roofed with metal sheeting. It is divided perpendicularly into two sections, one of which has two storeys; the second, although of one storey, is of exactly the same height as the other section, and will house electrically-operated cranes. In addition to Shops Nos.18, 24 and 28 (see sub-paragraph (a) above), Shop No.6 (function not known) from factory 84C is to be moved into the new building. In March 1959 this new building was almost completed, and Shops Nos.18 and 24 had already moved in.
- (c) No.17 Shop (vide sub-paragraph (c) above) was moved out of the building hitherto shared with No.34 Shop (aircraft spraying/painting) in order to allow more room for No.34 Shop in view of the larger size of the new aircraft. Part of the space occupied originally by No.17 Shop is now a scrap at the paragraph.

SECRET & S. OFFICIATS ONLY

SFCRET

50X1-HUM

10. Constructional Processes and Chan as Therein:

- (a) Rubber Petrol Tanks: The IL-17 will use rubber petrol tanks instead of the metal ones used in earlier aircraft produced at Plant 84D. Shop No.10 (rubber components) will take over this additional responsibility.
- (b) The engine ducts (tubes or pipes?) in the H-17 are made in Shop No.15 from a special new light-weight metal enalgan of steel and unoxydized aluminium called "NEMZEVATKA", instead of "Steel No.20" which was used for the H-14. Whereas in the H-14 a total of c.380 engine components made of "Steel No.20" were used, the H-17 will have c.1,200 components, all made of "NERAZEVATKA" except for c.30 made from "Steel No.20". Pressure resistance of the steel tubing is 4 Atmospheres as opposed to that of the duraluminium which was 2 Atmospheres.
- (c) Noils Shop also undertakes the "chamical washing" of the ducts

 (tubes or pipes?) it produces. This is a three-stage process:

 compressed air and sand, petrol, and finally an unspecified liquid

 chamical solution.

 50X1-HUM

11. Airfield:

The airfield adjoining the factory is

50X1-HUM

used for testing aircraft produced at Plant 34B and as a flyaway.

There is, however, a Soviet hir Force unit stationed at the airfield, with barracks at its Lastern extremity. This is estimated to consist of some 200 men and 50 officers, the highest rank seen being that of Lt.-Colonel

The unit disposes of 30 - 35 vehicles (ZIS-150, ZIS-120, GLS-51 "MOLOTOV" plus a small number of saloon cars for the use of officers. A sketch of the encomponent area is attached at Appendix B, together with a key.
